

Belfast 2036

WeeGrid: Community Solar

*Turning neighbourhoods into
shared clean energy systems*

Presented By:
Muckers in the mainframe

The Problem

Slow and inefficient adoption:

- High energy costs for households
- Solar is expensive + unevenly accessible
- Communities don't coordinate

How WeeGrid Works:

Neighbourhoods as a single optimised system

Enter postcode

Identify a local area to analyse and organise

Build your cluster

Select nearby homes to form a shared energy group

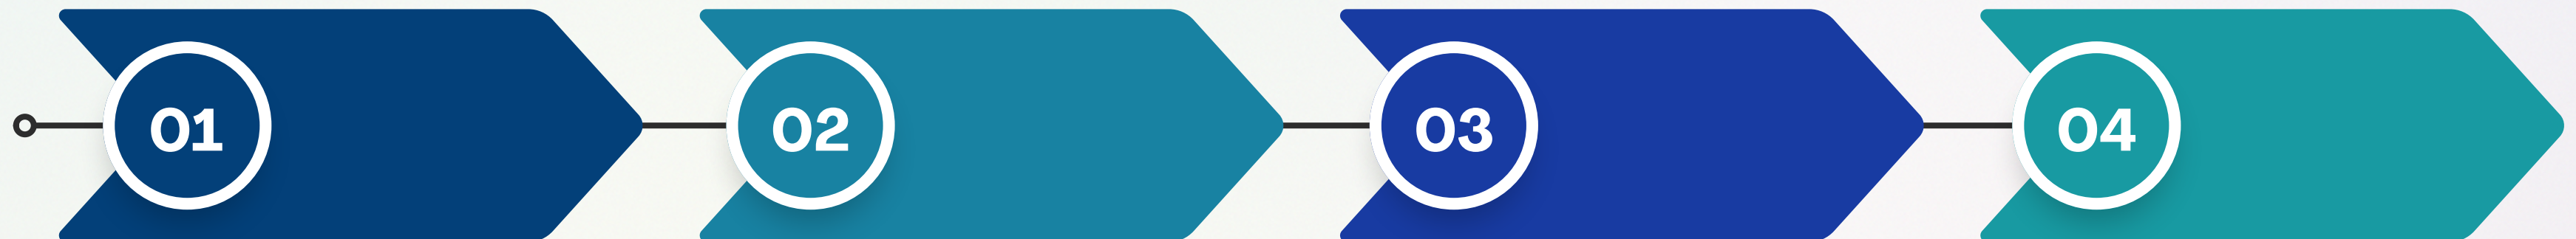

Manage finances

Pool investment and estimate costs, savings, and returns

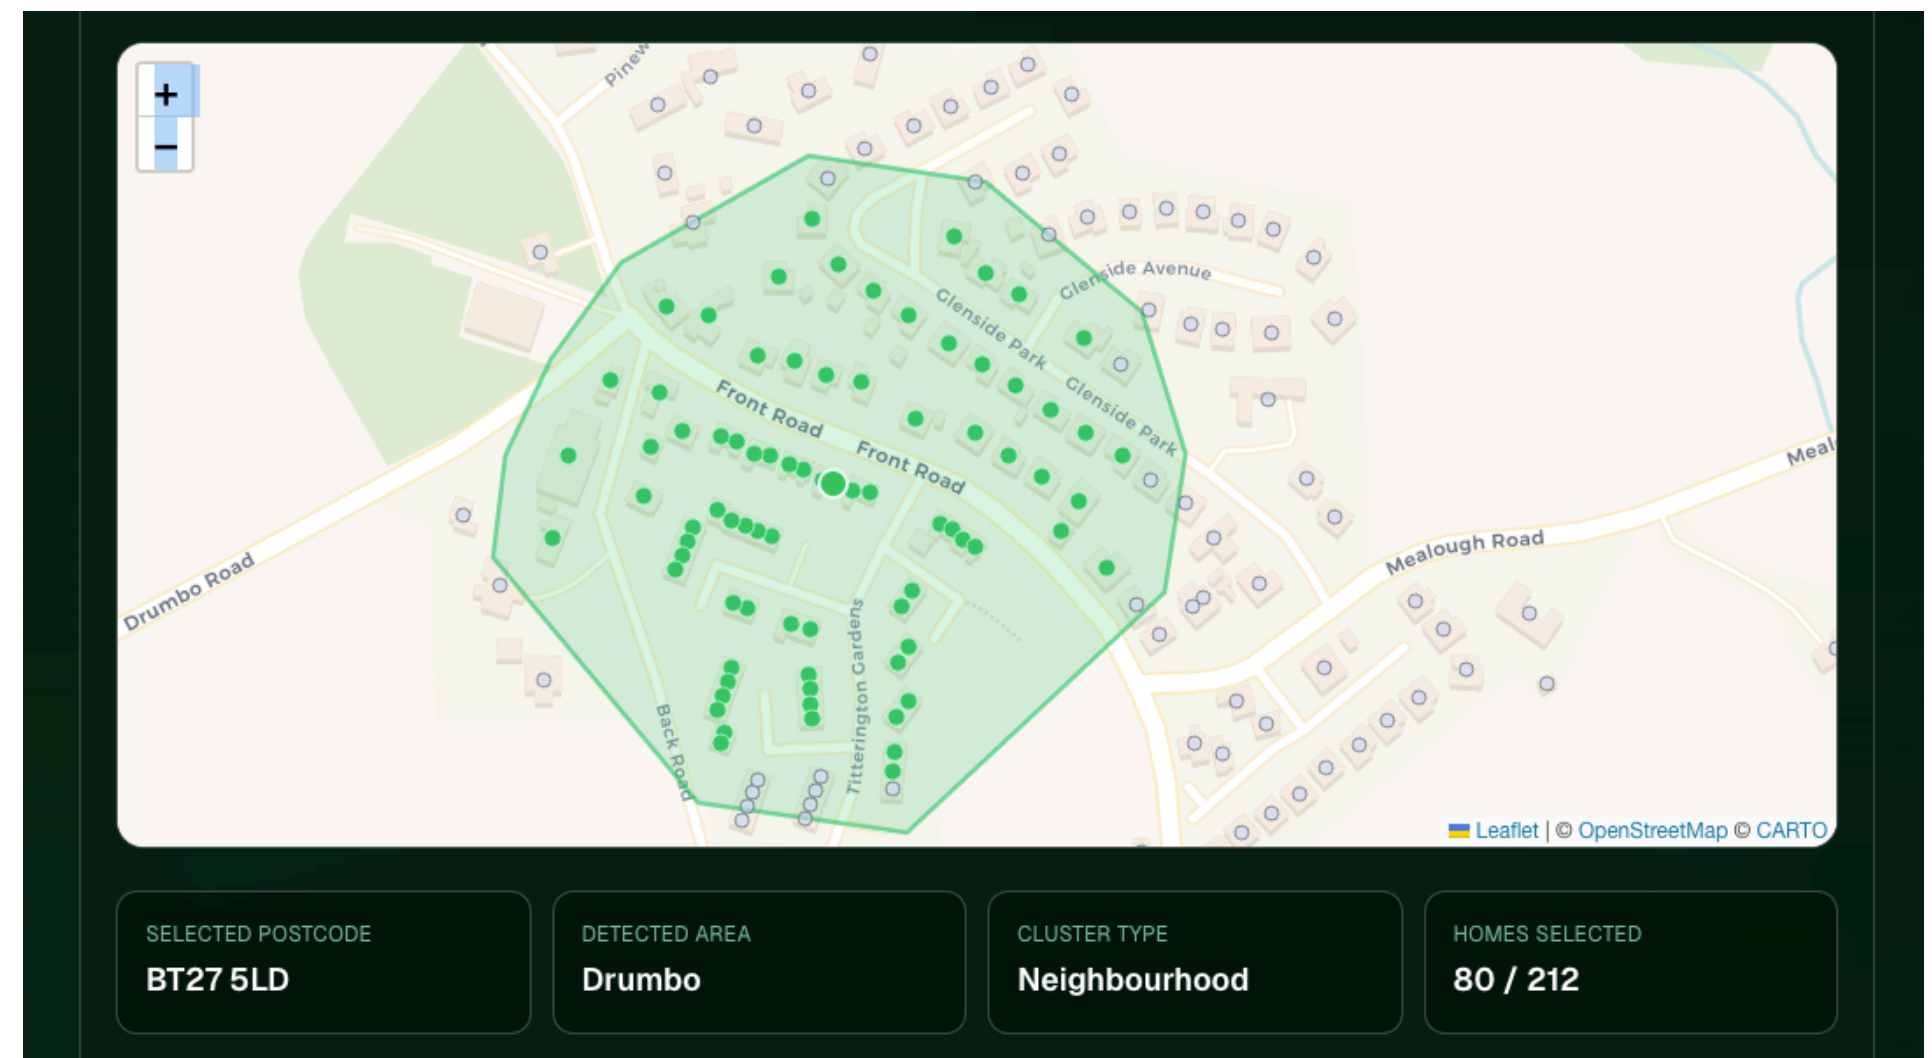

Area suitability check

Validate if the location is viable for solar deployment

What We Built

- Map-based clustering
- Community investment model
- Area validation tool
- Estimate solar output
- Calculate total energy generation
- Convert to cost savings + payback

Belfast & The Future

Reduces household energy costs

Scales across neighbourhoods

Encourages local investment

Contributes to renewable energy targets

Next Steps:

- Real rooftop + solar data
- Integration with grants
- Deployment via councils / communities
